You can't artificially enforce your signal with an app. Most apps that claim to do so just active your mobile data or WiFi on and off or some other Basic Super Trick to reset the connection to the network. Basically, they are app versions of turn something off and back on again. However, there are outdoor apps that can help you identify issues so you can more easily solve them. There are a variety of ways to fix these issues all on your own once you know what to look for. Here are the best mobile network apps for Android and some other methods too. Read more: 10 best Android tools and utilities apps15 Best Android VPNsGlasWirePrice: Free / \$39.99-\$99.99 per aneGlassWire is a useful network tool. It displays your device's connections and all the data it both sends and receives. This is useful for condoning and slow data speeds, but decent signal strength because it can help root out apps that abuse your data behind containment. It won't help diagnose current strength signal problems, but if something is popping off and using constant data, it will definitely manifest as slower speeds and inconsistent connections. We recommend starting here with the free version allows you to view data usage of all your apps. ToolsPrice IP: Free / \$2.99There several IP Tools apps on the play store, but we chose this one for its cheap price tag and relatively good functionality. The app has a bunch of functions including a port scanner, WiFi scanner, a DNS lookup, an IP-host converter, and more. This is a bit more hardware than your general tools on mobile but it can provide good insights as to why your signal isn't doing as well as it should (on WiRe at least). The pro version is one \$2.99 in-app purchase.network Cell InfoPrice: Free / \$1.49 Cell Phone Network to help you find the nearest cell tower. Bad signals come from a variety of factors. The one that can just be distance from a tower. An app like this shows you where the towers are so you can see how far you are away. It should work on both GSM and CDMA companies and it supports dual SIM as well. Some other features include signal measurements and a crowd consumer signals. The pro version is \$1.49 and you need to unlock some of the features. OpenSignalPrice: Free (and ad)OpenSignal is a lot like Info Cell Phone Network. It shows you the 3G, 4G/LTE, and 5G towers of your general visitors. However, this one also works with WiFi signals. Basically, if you can connect it, OpenSignal can probably find it. This one works well for a variety of reasons. Better, though, is that it compares signaling strength between a four major companies in the U.S. to see if maybe a different one has a better signal where you live. There's also a map of coverage so you can see if maybe you just live in a weak area on your carrier. There's a lot of good information here to help diagnose a signal problem that makes it one of the best signal reminder apps. WiFi AnalyzerPrice: Free (and ad) There are a bunch of WiFi Analysers on mobile. We love this one because it's relatively easy to use, gets frequent updates, and works really well. The app not only shows you the WiFi signals from your home but people from nearby homes as well. You can get a really good sense of congestion in networking in your space with this app. From there, you can adjust your router settings to broadcast on fewer cluttered channels and that can help your signal problem. This one supports 2.4Ghz and 5Ghz connections with a bunch of other things. Bonus: Your router appris: FreeMost modern routers are configurable via an app. Linksys, Netgear, TP-Link, and other OEMs have apps. These apps are very useful because you can be active and change various settings. For example, I own a Netgear router and I use my app once to change my DNS to 1.1.1.1 (Cloudflare) instead of the default option to try and fix some speed issues. From there, you can Google Search issues with your router and how to fix them. Simply use the app to change the settings as recommended by others. These should work great as signal reminder apps. Get a signal reminder from your mobile carrier Sometimes there is no fix and you need some extra pieces. Most mobile insurance companies have an option for a signal booster. A signal reminder is a piece of the computer you installed in your home. The reminder receives signals from the OEM and empowers it to function properly in your home. All four great US carries are and some of them do some unique things. For example, Sprint has the TREBLE, an Alexa-powered Smart Speaker that also reinforces your home signal. Signal reminders are generally not too expensive and a technology will install one if you don't have to know-how to do it yourself. Boxes should fix any weak signal issues inside your home, but they obviously don't work when you're out and about. Below we have official signal reminders from the four major US OEMs and they work a lot better than reinforced signal apps in the Play Store. Dig around your environment Sometimes your phone has bad settings or settings that get in the way. For example, I now have a slightly 5G cover spot. I closed 5G on my LG and it flaws to the stronger, much more reliable 4G LTE network. This not only saves battery but my download speeds and download speeds are more consistent. This is something you may be able to replicate. Many devices let you choose whether or not to connect to 5G or 4G LTE. Additionally, if you have both a 2.4Ghz and a WiFi 5Ghz connection to your home, you may have errors connected to the wrong one. This is very generic advice because devices have many independent settings. For example, Samsung devices can download things on mobile data and WiFi at the same time to boost its performance. Moving away a Samsung device to another device can make it seem like your connection is worse off when Samsung was really just using two connections at once. We recommend roots around your Network environment and your WiFi environment and see what you can see. Don't worry, you can't do any permanent damage, but take a screenshot of the way your environments have been before you change anything in case you want to switch back. Also, try rebooting your phone. Sometimes you just need to turn it off and back on again. See if your phone has trouble signaling Some devices just have weaker antennas. It's not something too many people measure up anymore, but it happens. Anecdotally, my ZTE Axon 7 has got worse signal strength compared to my LG V20. Consequently, my Samsung Galaxy Note 10+ had a stronger signal than my LG V60 (not on one low). The device modem is attached to the SoC, so each phone with a Snapdragon model is using the same modem. However, device design, antenna design, and other factors can simply make one phone worse in retrieving one signal than another. There's not much you can do about it if this happens to you outside of possibly upgrading to a different phone or using a signal reminder from your mobile insurance company. Usually the differences of signals are not devastating, but if your signal wasn't great to start with, a phone and natively worse reception can point to dept. Using your WiFi when available A common tactic is simply avoiding your mobile data unless you have. Many devices these days let you make phone calls on WiFi and a lot of people can simply appeal on Facebook Messenger or a similar service-only. Using WiFi relay and avoiding your mobile network, it kind of doesn't matter if your signal isn't great inside the home because you're not using it anyway. Changing companies brings to People with weak mobile signals with no easy solutions. Maybe you live from the middle of nowhere where there are hardly any cell towers from any mobile insurance company. Maybe your home is constructed from block signal material. People who spend a lot of time in basement really can't do much. Your best bet if none of the above tasks are to look for alternative options. Make sure T-Mobile deals may have been sleek, but if T-Mobile doesn't have towers where you live, what's the point? This could happen with any insurance company as some weak areas support all Check out the insurance cover cards in your area to see if any of them have the outdoor towers that can give you better signals.
